Python C++ Masters

Job Description

- Support and maintain a hardware abstraction layer and special purpose engineering commands related to channel hardware applications
- Firmware integration of vendor channels to optimize HDD read/write performance and other necessary magnetic recording functions
- Develop validation scripts to be applied as developer and debug tools
- Create test scripts to be deployed within a Continuous Integration environment
- Follow Agile methodologies and have a willingness to become a contributing member of a scrum team that supports Enterprise level HDDs
- Plan, perform, summarize, and present findings with respect to channel verification, channel operations, technical experiments, and failure analysis results
- Be a reference for basic read/write channel functionality and applications
- Work in concert with suppliers' technical support teams and WDC internal product teams
- Provide problem solving, algorithm design, risk mitigation, and complexity analysis to support the channel applications within drive firmware
- Work with internal product development teams and external suppliers to provide firmware and test script abstractions of the channel hardware into HDDs on various platforms
- Provide firmware and tools support to integrate new channel features, perform failure analysis, and evaluate performance for an advanced digital signal processing chip used for Hard Disk Drive (HDD) magnetic recording

This position is part of our Early Career program at WD. Our Early Career program is designed to support individuals beginning their professional career by providing the foundational training through a structured onboarding, mentorship, and development curriculum.
